

Data-driven Mathematical Optimization with Python

Krzysztof Postek

Alessandro Zocca

Joaquim Gromicho

Jeff Kantor

Version of April 3, 2022

Contents

Contents	2
1 Mathematical optimization	5
1.1 A motivating example – A glass of water	5
1.2 What is mathematical optimization?	6
1.3 Example: Pop-up shop	7
1.4 Pyomo: Modelling and solving optimization problems in Python	10
1.5 What to expect from this book	11
2 Linear optimization	13
2.1 Formulation	13
2.2 Modeling techniques	15
2.2.1 Absolute values	15
2.2.2 Minimax objective	21
2.2.3 Fractional objective	21
2.3 Duality	24
2.4 Solution methods	27
2.5 A complete example	29
2.5.1 The model	30
2.5.2 The Pyomo implementation	30
2.5.3 The optimal solution	32
3 Mixed-integer linear programming	37
3.1 Formulation	37
3.2 Modelling techniques	42
3.2.1 Variables taking a set of discontinuous values	42
3.2.2 Variable enforcing a given constraint or not	42
3.2.3 Cost function with a fixed component	43
3.2.4 Either-or constraints	43
3.2.5 If-then constraints	49
3.2.6 Products of variables	54
3.3 Solution methods	55
3.4 A complete example: BIM production revisited	59
3.4.1 Optimal solution	66
3.4.2 Impact on solving time	67
4 Network optimization	73
4.1 Introduction	73
4.2 Totally unimodular matrices and integrality of the solutions	75
4.3 Special network problems	75
4.3.1 Minimum-cost flow	75
4.3.2 Shortest path	76
4.3.3 Transportation	76
4.3.4 Maximum-weight bipartite matching	80
4.3.5 Max Flow and Min Cut	80
4.3.6 (Bipartite) Maximum matching	81

4.3.7	Travelling Salesman	83
4.3.8	Graph coloring	83
4.4	Modelling techniques	84
4.5	A complete example: Economic dispatch in power systems	87
4.6	Exercises	90
5	Convex optimization	91
5.1	Introduction	91
5.2	Convex functions	93
5.3	Convex sets	96
5.4	Convex optimization	96
5.5	Duality for convex optimization	97
5.5.1	Analogy to LP duality	97
5.5.2	Weak and strong duality	98
5.5.3	Karush-Kuhn-Tucker (KKT) conditions	100
5.6	Solution methods	101
5.6.1	Analytical	101
5.7	A complete example	104
5.8	Exercises	104
6	Conic optimization	105
6.1	Introduction	105
6.2	Modelling constraints with cones	107
6.2.1	Specific constraint examples	107
6.2.2	Calculus of SOCP representable sets	108
6.3	Duality in conic optimization	110
6.4	Numerical solution methods	113
6.5	A complete example	113
6.6	Exercises	113
7	Accounting for uncertainty: Optimization meets reality	115
7.1	Introduction	115
7.2	Impact and sources of uncertainty	117
7.3	Modelling with uncertainty in mind	118
7.4	Outlook and assumptions for the remainder of the book	120
8	Robust optimization – Single stage problems	121
8.1	Introduction	121
8.2	Modelling issues	123
8.2.1	Robustness shrinks the feasible set	123
8.2.2	Removing equality constraints affected by uncertainty	123
8.2.3	Non-equivalence of ‘equivalent’ robust problems	124
8.2.4	Removing uncertainty from the objective	125
8.2.5	Modelling - summary	125
8.3	Building the uncertainty set	125
8.3.1	Introduction	125
8.3.2	Box uncertainty	126
8.3.3	Budgeted uncertainty	126
8.3.4	Ellipsoidal uncertainty	127
8.3.5	General conic uncertainty set	127
8.3.6	Calibrating the uncertainty set	127
8.3.7	Summary	128
8.4	Solution methods	128
8.4.1	Adversarial approach	128
8.4.2	Robust counterparts of constraints	129
8.5	A complete example	132
8.6	Exercises	132

9	Stochastic optimization - Single stage problems	135
9.1	Introduction	135
9.2	How to obtain distributional information	136
9.3	Dealing with expectations	136
9.3.1	Expectation as a known, deterministic function	137
9.3.2	Sample average approximation	137
9.4	Chance constraints	138
9.4.1	Modeling using chance constraints	138
9.4.2	Discrete distributions: the MILP reformulation	139
9.4.3	General distributions: log-concavity and convexity of chance constraints	140
9.4.4	Sampling-based approach	142
9.5	Risk measures	143
9.6	Sequel: distributionally robust optimization	144
9.7	A complete example	144
9.8	Exercises	145
10	Robust optimization – Two-stage problems	147
10.1	Introduction	147
10.2	Modelling two-stage problems	148
10.3	Solution approaches	149
10.3.1	Column and constraint generation	149
10.3.2	Decision rules	150
10.4	A complete example	151
10.5	Exercises	151
11	Stochastic optimization - Two stage problems	153
11.1	Introduction	153
11.2	Solution methods	157
11.2.1	The SAA method	157
11.2.2	The L -shaped algorithm	158
11.2.3	Convergence of the L -shaped algorithm	164
11.2.4	Additional discussion	164
11.3	A complete example	164
11.4	Exercises	164
.1	Lagrange Duality for MILO	165
.1.1	Constrained shortest path problem	165
.1.2	Lagrangian relaxation	168
.1.3	Constrained shortest path problem – pt.2	168
.1.4	Lagrangian duality for MILO	170
.2	Subgradients and separation	173
.3	Descent algorithms	173
.3.1	Descent algorithm in the convex case: the subgradient method	174
.3.2	Example of subgradient method	174
.4	Subgradient method for Lagrangian dual	175
